# Eisenhower Matrix: Purdue Dining Menu Watcher

Jorge Guardia - CS 193, Homework 9. Feature priority for the dining menu watcher script.

| Do (MVP - build first) | Schedule (after the MVP works) |
| --- | --- |
| • Pull each dining court's menu for today from the Purdue dining API with curl<br>• Match menu items against a favorites list stored in a plain text file<br>• Print which court and which meal (breakfast/lunch/dinner) has each favorite<br>• Save a dated snapshot of the day's menus to a file | • Email me when a favorite is found instead of only printing<br>• Cron job so it runs every morning on its own<br>• Weekly stats on how often each favorite shows up<br>• Separate favorite lists per meal |
| **Delegate (only if there is time)** | **Delete (out of scope for this project)** |
| • Colored / pretty terminal output<br>• Dietary filters (vegetarian, halal, etc.)<br>• A nicer demo GIF for the README | • GUI or mobile app<br>• Support for other universities<br>• Calorie or macro tracking<br>• Sharing / social features |
